

New Technologies

Moderators: Katherine Alben, NY State Department of Health; Herb Brass, USEPA, Office of Ground Water and Drinking Water

What current water quality monitoring challenges are we facing? Where are new and innovative approaches needed? Are there new technologies available to meet these challenges and provide the innovative approaches? This workshop will turn an eye to the future of monitoring for chemical and biological contaminants. Case studies will highlight experiences with new technologies (including probes and sensors), using a common framework to assess improved procedures and method performance from development to implementation. Workshop attendees will be invited to participate with speakers in a focused discussion of management and data quality issues associated with the use of new technologies for environmental monitoring.
